

# Fil de Contention Post ortho décollé Traité avec BRUSHDIP

**BRUSHDIP and a debonded metal  
wire !!**

A case from Dr Lucile DAHAN  
ADDA  
Paris -France

# La situation de départ/ First clinical view

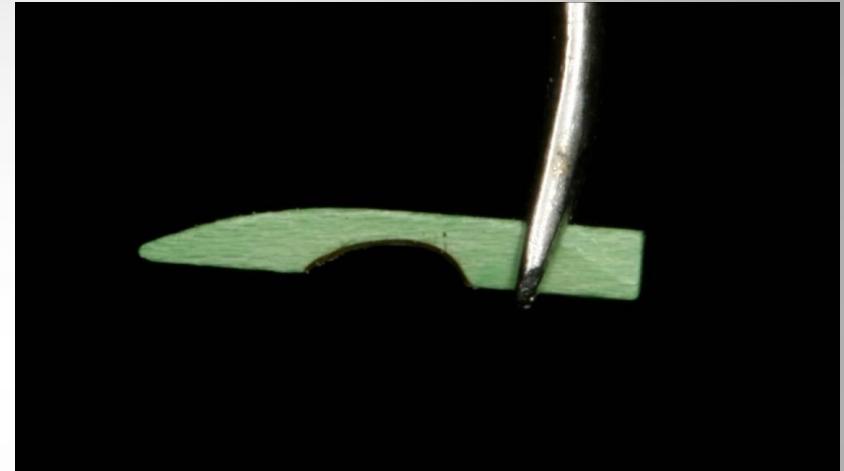

Dépot du fil/After removal of the metal wire

# Mordançage de l'émail /Enamel acid etching

Coin de bois modifié pour obtenir une surface convexe de  
Brushdip et eviter de créer un piège à plaque dentaire /  
Modified wooden wedge in order to create convex surface for a  
good oral hygiene

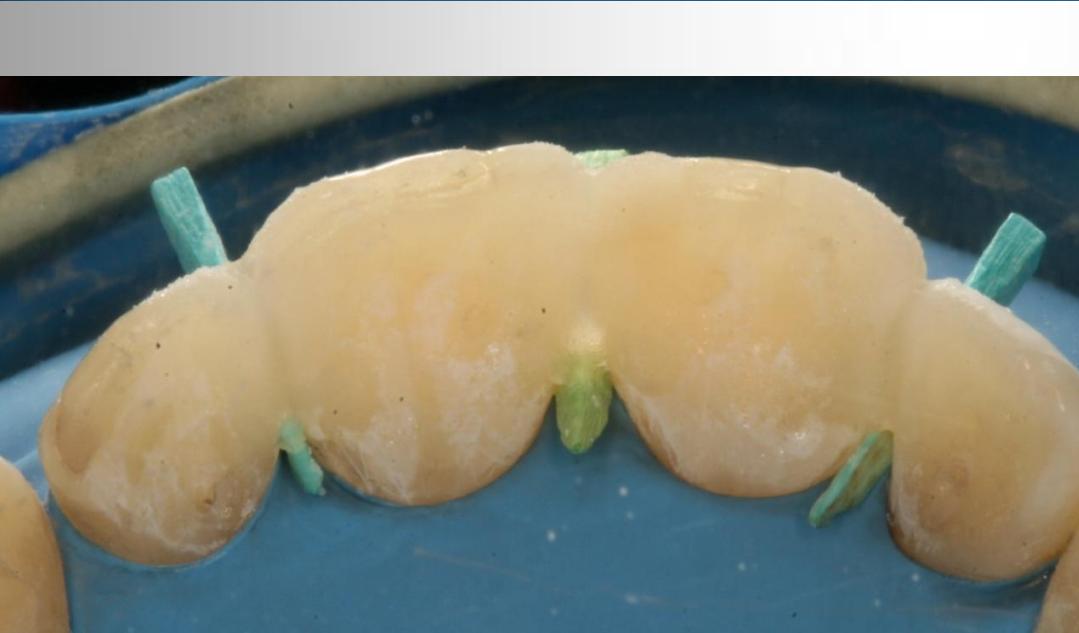

Application des 2 liquides mélangés  
(initiateur + monomère Brushdip)/  
Application of the liquid mix (Brushdip  
initiator+monomer)

# Application de la boule de BRUSHDIP/ Resin ball application

A close-up photograph of a dental bridge or veneer placed on a blue dental base. The bridge consists of several light-colored, rounded dental crowns. The central two crowns are significantly larger and more prominent, likely representing the upper central incisors. The surrounding smaller crowns represent the upper lateral incisors and canines. The bridge is held in place by metal wires visible on the left and right sides.

Vue finale / Final view

A close-up photograph showing two dental teeth whitening trays. The upper tray is light-colored and has a central vertical seam. The lower tray is a darker shade of yellowish-orange and shows signs of wear or discoloration along its edges. Both trays are placed over a set of upper teeth, which appear white and healthy.
